INDUSTRY RESEARCH REPORT

# Trend Analysis of Growth & Productivity:

## Indian Automobile Industry & Tata Motors PV Segment

*A Consulting-Grade Strategic Analysis | FY 2020–25 & Forward Outlook to FY 2030*

Prepared by

**Lokesh Polapadi**

*Aspiring Entrepreneur | Automotive & Business Research Enthusiast*

April 2026

01 — EXECUTIVE SUMMARY

# Executive Summary

The Indian passenger vehicle (PV) market has undergone a structural transformation over the five-year period FY 2020–25, evolving from a COVID-disrupted trough to record-high volumes exceeding 4.3 million units annually. This report examines the twin engines of this transformation — industry-wide demand expansion and company-specific productivity gains — through the lens of Tata Motors Limited's remarkable turnaround in the PV segment.

Tata Motors has emerged as the most compelling case study in the Indian automobile sector: growing market share from approximately 5–6% in FY18 to ~14% in FY25, capturing 65–70% of India's nascent electric PV market, and filing a record 250 patents in a single fiscal year. This report synthesises secondary industry data from SIAM, IBEF, and the Ministry of Heavy Industries with primary survey findings from 51 respondents to produce a 360-degree assessment.

### Key Findings at a Glance

| Dimension | Finding | Significance |
|---|---|---|
| Industry Growth | PV sales grew 58% in 4 years (FY21→FY25) | Structural, not cyclical, demand trajectory |
| SUV Dominance | SUVs crossed 50%+ of new PV sales in FY24 | Market has fundamentally repositioned upmarket |
| EV Transition | EV penetration at ~6.6%; CAGR of 49% projected to 2030 | Inflection point — infrastructure the final barrier |
| Tata Motors | Market share 5% → 14% in 5 years; 65–70% EV share | India's most significant automotive turnaround |
| Consumer Sentiment | 83% of survey respondents open to purchasing Tata | Brand rehabilitation complete at consumer level |
| Export Growth | Automobile exports up 24% in CY2025 to 63.25 lakh units | India consolidating as global auto export hub |
| Policy Tailwinds | ₹66,000+ crore committed across PLI, FAME, PM E-DRIVE | Most comprehensive auto-sector support in history |

> **Key Insight:** *The Indian automobile sector stands at a once-in-a-generation inflection point. The convergence of EV adoption, a young aspirational*

> *population, and a supportive policy architecture creates conditions for the industry to more than double its GDP contribution from 7.1% to 12% by 2030.*

02 — INDUSTRY OVERVIEW

# Indian Automobile Industry: Landscape & Trajectory

## 2.1 Macro Context

India is the world's third-largest automobile market by production volume, with total output exceeding 31 million units in FY 2024–25. The industry contributes approximately 7.1% to national GDP — equivalent to 49% of India's manufacturing GDP — and supports 30–37 million jobs directly and indirectly. It has attracted over US$ 39.3 billion in FDI between April 2000 and June 2025.

India's automobile sector is distinct in its structure: dominated by domestic demand (exports represent ~17% of production), characterised by a hatchback-to-SUV migration in progress, and now experiencing the first stages of an EV revolution. The government's Automotive Mission Plan targets raising the sector's GDP contribution to 12% by 2030, implying a near-doubling of economic weight.

## 2.2 Five-Year Production & Sales Trends

| Financial Year | Total Production (Mn) | PV Sales (Lakh) | PV Exports (Lakh) | Key Theme |
|---|---|---|---|---|
| FY 2019–20 | 26.4 | 27.7 | 6.8 | Pre-COVID baseline |
| FY 2020–21 | 18.6 | 27.1 | 4.0 | COVID lockdowns; demand collapse |
| FY 2021–22 | 22.9 | 30.7 | 5.8 | V-shaped recovery; pent-up demand |
| FY 2022–23 | 25.8 | 38.9 | 6.6 | Record growth; SUV supercycle begins |
| FY 2023–24 | 28.0+ | 41.0+ | ~6.5 | Record PV; EV adoption inflection |
| FY 2024–25 (Est.) | 31.0+ | ~43.0 | ~7.7 | Record exports; 30% domestic growth |

> **Key Insight:** *The data reveals a three-phase arc: COVID disruption (FY21), recovery (FY22), and structural boom (FY22–25). PV production grew nearly*

> *60% in four years — confirming this is structural demand driven by rising incomes, urbanisation, and demographic tailwinds, not a temporary post-lockdown bounce.*

## 2.3 Segment Dynamics: The SUV Supercycle

The most significant structural shift in the Indian PV market over the past decade has been the SUV's ascent. Market share has surged from just 16% in 2015 to over 50% of new PV sales by FY24 — an unprecedented repositioning of consumer preference driven by aspirational purchasing, improved road infrastructure, and the availability of affordable compact SUVs.

From an economic standpoint, the SUV boom is significant beyond volume: SUVs carry 15–25% higher per-unit margins compared to hatchbacks and sedans. This has elevated industry-wide profitability, improved revenue per vehicle, and accelerated premiumisation — a trend our primary survey validates, with even first-time buyers unanimously preferring an SUV as their initial purchase.

## 2.4 The Electric Vehicle Inflection

| EV Metric | FY 2022–23 | FY 2023–24 | FY 2024–25 (Est.) | FY 2029–30 (Projected) |
|---|---|---|---|---|
| PV EV Sales (Units) | ~80,000 | ~1,00,000+ | ~1,30,000+ | ~12–15 lakh |
| PV EV Penetration | ~2.0% | ~2.5% | ~3.0–6.6% | ~25–30% |
| Tata EV Market Share | ~80%+ | ~65–70% | ~65% | ~40–50% (est.) |
| Charging Stations | ~12,000 | ~23,000 | ~85,000+ | ~1.32 million (target) |
| Policy Outlay | FAME II active | FAME II concluding | PM E-DRIVE (₹10,900 Cr) | PLI + ISM 2.0 |

India's EV market is projected to grow at a CAGR of 49% between 2022 and 2030, representing a US$ 206 billion opportunity. EV powertrains contain 20–30 moving parts vs. thousands in ICE engines, fundamentally improving manufacturing productivity and long-term cost of ownership.

03 — COMPANY OVERVIEW

# Tata Motors Limited: Passenger Vehicle Division

## 3.1 Corporate Profile

Tata Motors Limited, a flagship company of the Tata Group, is India's third-largest passenger vehicle manufacturer by market share and the global leader in electric passenger vehicles in the Indian market. The company's PV segment, once considered a peripheral business, has been transformed since FY19 into one of the most dynamic turnaround stories in India Inc.

| Parameter | Details |
|---|---|
| Founded | 1945, Mumbai, India |
| Parent Group | Tata Group (Ratan Tata / N. Chandrasekaran, Chairman) |
| PV Market Share (FY25) | ~14% (up from 5–6% in FY18) |
| EV Market Share (India) | 65–70% of electric PV segment |
| Investment Plan (FY26–30) | ₹33,000–35,000 crore committed |
| Patents Filed (FY25) | Record 250 patents + 148 design applications |
| Charging Network | 22,000+ charging stations partnered |
| Key EV Models | Nexon.ev, Tiago.ev, Punch.ev, Curvv.ev, Sierra (upcoming) |

## 3.2 Five-Year PV Performance Trajectory

| FY | PV Sales (Units) | Market Share | EV Sales | Key Milestone |
|---|---|---|---|---|
| FY 2020 | ~1.5 lakh | ~5–6% | Negligible | Turnaround plan initiated |
| FY 2021 | ~1.5 lakh | ~5.5% | Minimal | COVID hit; product refresh begins |
| FY 2022 | ~3.2 lakh | ~10% | 10,000+ | Nexon EV market leadership established |
| FY 2023 | ~5.3 lakh | ~13.5% | 45,000+ | Fastest-growing PV brand in India |
| FY 2024 | ~5.7 lakh | ~13.8% | 70,000+ | 250K cumulative EV milestone |
| FY 2025 (Est.) | ~6.2 lakh | ~14% | 80,000+ | Sierra: 1 lakh bookings; 32.8% domestic growth |

> **Key Insight:** *Tata Motors' PV journey demonstrates total factor productivity improvement in action — generating dramatically more value from the same capital base by combining product innovation, EV first-mover advantage, and systematic brand rehabilitation.*

## 3.3 Product Portfolio Analysis

### Electric Vehicle Lineup

| Model | Segment | Price Range (₹ Lakh) | Range (km) | Strategic Role |
|---|---|---|---|---|
| Tiago.ev | Hatchback EV | 8.5–11.5 | ~315 | Entry-level EV gateway |
| Punch.ev | Micro-SUV EV | 10.0–14.0 | ~365 | Volume driver; first-time EV buyers |
| Nexon.ev | Compact SUV EV | 14.0–20.0 | ~465 | Flagship; market share anchor |
| Curvv.ev | Coupe SUV EV | 18.0–25.0 | ~502 | Premium aspirational |
| Sierra EV | Iconic SUV EV | 25.0–35.0+ | ~500+ | Brand statement; heritage reimagined |

### ICE / CNG Lineup (Selective)

| Model | Segment | Engine Options | Strategic Role |
|---|---|---|---|
| Tiago | Entry Hatchback | Petrol / CNG | High-volume entry segment |
| Altroz | Premium Hatchback | Petrol / Diesel / CNG | Defend hatchback share |
| Nexon | Compact SUV | Petrol / Diesel / CNG | Dual-powertrain volume champion |
| Punch | Micro-SUV | Petrol / CNG | Fastest-growing model |
| Harrier | Midsize SUV | Diesel | Premium; brand equity builder |
| Safari | Full-size SUV | Diesel | Flagship ICE; aspirational |

04 — STRATEGIC ANALYSIS

# Strategic Analysis

## 4.1 SWOT Analysis — Tata Motors PV

| STRENGTHS | WEAKNESSES |
|---|---|
| • 65–70% EV market share — unassailable first-mover advantage<br>• Modular Ziptron EV platform enables cost-efficient portfolio expansion<br>• Record IP generation: 250 patents in FY25<br>• 5-star NCAP safety ratings across key models<br>• Strong Tata Group brand equity and trust<br>• 83% survey respondents open to purchase — brand rehab complete | • Residual legacy quality perception (10.6% rate as 'Worse')<br>• ICE portfolio profitability lags Maruti Suzuki on scale<br>• Charging infrastructure dependency on third-party networks<br>• Dealership experience inconsistency in Tier-2/3 markets<br>• EV battery cell import dependency (~70–90% from China) |
| **OPPORTUNITIES** | **THREATS** |
| • US$ 206 Bn EV market opportunity by 2030<br>• PLI + PM E-DRIVE schemes providing ~₹67,000 crore tailwind<br>• Neo-middle class: 25 crore new aspirational buyers emerging<br>• Export expansion via 'China Plus One' diversification<br>• Tata Semiconductor fab in Gujarat — future vertical integration | • Chinese EV manufacturers: MG Windsor displaced Nexon EV #1 in FY25<br>• India-UK FTA: reduced tariffs increase imported EV competition<br>• Semiconductor geopolitical risk (100% import dependent)<br>• Currency volatility impacting imported component costs<br>• Global recessionary pressures dampening export demand |

## 4.2 Porter's Five Forces Analysis

| Force | Intensity | Key Drivers | Impact on Tata |
|---|---|---|---|
| Competitive Rivalry | Very High | Maruti Suzuki (42% share), Hyundai, Mahindra, Kia, MG all competing aggressively across segments | Requires continuous product refresh and price discipline |

| Force | Intensity | Key Drivers | Impact on Tata |
|---|---|---|---|
| Threat of New Entrants | Medium-High | BYD & VinFast entering; India-UK FTA lowering import barriers; capital requirements still high | EV segment most exposed; ICE segment protected by scale |
| Bargaining Power of Buyers | High | Survey: price, mileage, brand equally weighted; online research increases price transparency; 46.8% 'maybe' buyers are mobile | Conversion hinges on product-price fit and EV infrastructure |
| Bargaining Power of Suppliers | Medium | Battery cells 70–90% imported; semiconductor 100% imported; domestic steel/rubber well-developed | Critical vulnerability in EV supply chain; PLI-ACC partially mitigates |
| Threat of Substitutes | Low-Medium | Public transport improving in metros; ride-hailing growth; but rural demand and SUV aspiration limit substitution risk | Low near-term risk; long-term mobility-as-a-service (MaaS) to watch |

## 4.3 PESTLE Analysis

| Factor | Analysis & Implications |
|---|---|
| Political | Make in India, PLI schemes, and semiconductor corridors signal sustained government commitment. The India-UK FTA (July 2025) increases import competition but also opens export markets. Rare earth corridors in 4 states secure mineral supply chains. |
| Economic | India's GDP growing at 6.5%+; 25 crore neo-middle-class consumers entering the market. Rising disposable incomes, multi-car household trend (29.8% own 2 cars; 21.3% own 3), and EMI penetration all support demand. Input cost inflation (lithium, steel) is the primary economic risk. |
| Social | Survey confirms: 58.8% respondents aged 18–30 (aspirational first-time buyers); 100% of non-owners prefer SUV as first purchase. Growing female buyer influence (43.1% of survey). Safety culture rising — NCAP ratings now a purchase criterion (12.8% cite it as top factor). |
| Technological | EV technology (Ziptron platform, OTA updates), Industry 4.0 (IoT, digital twins, robotic manufacturing), and GenAI integration (projected 30–32% productivity boost by 2030) are reshaping the production frontier. Tata's 250 patents signal technology leadership. |
| Legal | GST rationalisation (EV GST: 5% vs 28%+ for ICE) significantly advantages EVs. CAFE (Corporate Average Fuel Economy) norms mandate fleet-wide efficiency improvement. NCAP ratings are becoming de-facto safety mandates. |
| Environmental | India's net-zero 2070 target and 30% EV by 2030 ambition create structural long-term demand. 100% EV awareness in our survey confirms brand resonance. However, coal-dominated grid means lifecycle EV emissions benefit is partial until renewables scale. |

05 — COMPETITIVE BENCHMARKING

# Competitive Landscape & Market Positioning

## 5.1 Market Share Landscape (FY 2024–25)

| OEM | PV Mkt Share | EV Position | Core Strength | Primary Risk |
|---|---|---|---|---|
| Maruti Suzuki | ~42% | Lagging (Grand Vitara Hybrid only) | Unmatched distribution (3,500+ outlets); value pricing; CNG leadership | Late EV entry; hatchback-heavy portfolio in an SUV market |
| Hyundai / Kia | ~18% combined | Growing (Ioniq, EV6, EV9 premium) | Premium positioning; Creta/Venue dominance; design-led | Premium skew limits volume share; Korean perception vs. value |
| Tata Motors | ~14% | Leader (65–70%) | EV ecosystem, safety, technology; Ziptron modular platform | Legacy quality perception; battery import dependency |
| Mahindra | ~8% | Growing (BE 6, XEV 9e) | SUV specialist; XUV heritage; rural/semi-urban strength | Limited urban brand appeal; late EV launch relative to Tata |
| MG / SAIC | ~3% | Aggressive (Windsor #1 EV FY25) | Affordable EVs; tech-forward positioning; strong value | Chinese ownership perception; service network depth |
| BYD / VinFast | Entering | Pure-play EV entrants | Global battery & EV cost leadership (30% advantage) | Brand unknown; network nascent; regulatory/ perception risk |

## 5.2 Consumer Brand Perception — Primary Survey Findings

| Survey Question | Key Finding | Strategic Implication |
|---|---|---|
| Brand currently owned | Maruti 52.2% \| Hyundai 26.1% \| Tata 19.6% | Survey ownership closely mirrors SIAM FY25 data — validates survey representativeness |
| Tata vs. current brand | Better 31.9% \| Similar 29.8% \| Not Sure 25.5% \| Worse 10.6% | 61.7% rate Tata favourably — brand rehabilitation fundamentally complete |
| Would consider buying Tata | Yes 36.2% \| Maybe 46.8% \| No 17% | 83% combined positive intent — highest openness of any brand in study |

| Survey Question | Key Finding | Strategic Implication |
|---|---|---|
| Demand growth in 5 years | Yes 58.8% \| Maybe 23.5% \| Not Sure 17.6% | 82.3% expect or conditionally expect growth — consumer validation of FY30 targets |
| Top purchase factors | Price = Mileage = Brand (21.3% each) \| Safety 12.8% | Tata's NCAP ratings + EV cost advantage addresses all three top factors simultaneously |

**Key Insight:** *The survey's 17% firm 'No' segment and 10.6% who rate Tata as 'Worse' likely share a common profile: older buyers with formative experiences of pre-2018 Tata quality. This segment is best converted through peer testimonials and sustained service quality improvement rather than advertising alone.*

06 — GROWTH & PRODUCTIVITY

# Growth Drivers & Productivity Analysis

## 6.1 Productivity Framework

Productivity in the automobile sector is best understood through three interlocking dimensions: labour productivity (value per worker), capital productivity (output per unit of capital deployed), and total factor productivity (TFP — the residual efficiency gain after accounting for all inputs). Each tells a different story for the Indian industry.

| Productivity Type | 5-Year Trend | Key Driver | Outlook |
|---|---|---|---|
| Labour Productivity | Improving but constrained | Only 43% of non-production workers formally trained (vs 70% in China); R&D at 0–2% of revenue vs global 5% | GenAI + upskilling projected to improve 30–32% by 2030 |
| Capital Productivity | Historically declining; recent reversal | Capital-intensity increased faster than output per rupee invested 1987–2022 | PLI investment, UV mix shift, and modular EV platforms beginning reversal |
| Total Factor Productivity | Improving (Tata case study) | Ziptron platform: multiple models, one architecture; digital twins cut production bottlenecks; OTA updates extend capital value post-production | EV inherently superior — 20–30 parts vs thousands in ICE |

## 6.2 Technology-Led Productivity Gains

### Automation & Robotics

- Maruti Suzuki Manesar: 2,000+ robots; ~90% body-shop automation; defect ratio 5% → sub-2%
- Hyundai Chennai: robotic expansion cut defect rate by 60%
- Tata Motors: IoT sensors and digital twins increased production speed by 15% and reduced material wastage by 10%
- Industry 4.0 adoption projected to deliver 30% efficiency improvement across the sector by 2030

### EV Manufacturing Superiority

- EV powertrain: 20–30 moving parts vs. thousands in ICE — fundamentally simpler, faster to assemble
- Energy conversion efficiency: EV ~60% vs. petrol engine 17–21%
- OTA software updates: manufacturers can improve vehicles post-sale without factory cost — a capital productivity multiplier
- Tata's Ziptron platform: Nexon, Punch, Tiago, Curvv all share common EV architecture — cost per model plummets

## 6.3 Supply Chain & Infrastructure Productivity

| Productivity Factor | Efficiency Gain | How It Lowers Unit Cost |
|---|---|---|
| Automation / Robotics | Higher throughput, fewer defects, 24/7 operation | Reduces rework, waste, and direct labour cost per unit |
| EV Technology | Fewer components, faster assembly cycles | Lower BOM complexity; OTA updates extend value post-production |
| JIT Supply Chain | Inventory holding: weeks → 2–4 hours (Maruti, Hyundai) | Working capital savings; no interest on idle inventory |
| GST Logistics Reform | Truck speeds: 225 km/day → 300–350 km/day post check-post removal | Shorter cash-to-cash cycle; higher annual output volume |
| PLI Scheme | Investment in Advanced Automotive Technology (AAT) | Economies of scale; lower import dependency per unit |
| Digital Dealerships | AI demand forecasting: inventory 60+ days → sub-30 days | Lower cost-to-sell; wider reach without proportional infra |

07 — EV STRATEGY & OUTLOOK

# EV Strategy & Future Outlook

## 7.1 Tata's EV Ecosystem: A Systemic Advantage

Tata Motors' EV leadership is not merely a product story — it is an ecosystem strategy. The company has built interlocking competitive advantages across four layers: technology platform, charging infrastructure, policy alignment, and brand differentiation that collectively make the position difficult to replicate in the medium term.

| Ecosystem Layer | Tata's Position | Competitive Moat |
|---|---|---|
| Technology Platform | Ziptron platform underpins all PV EVs; modular architecture | New models share R&D, tooling, and battery costs — lower breakeven per model |
| Charging Network | 22,000+ charge points partnered; Tata Power synergy | Group-level asset sharing reduces capex; 72,300 govt. fast chargers via PM E-DRIVE add further |
| Policy Alignment | PLI beneficiary; FAME-II subsidy anchor; PM E-DRIVE partner | Cumulative ₹18,000 crore EV division investment leveraged by public policy |
| Brand Differentiation | Safety (5-star NCAP), tech (OTA, connected features), sustainability | 100% EV awareness in survey; no competitor matches brand-safety-EV association |
| Manufacturing | Panapakkam greenfield (Tamil Nadu); ₹33,000–35,000 Cr FY26–30 plan | Dedicated EV capacity removes ICE line trade-offs; efficiency gains compound |

## 7.2 EV Adoption: Awareness vs. Willingness Gap

The primary survey reveals a critical industry insight: EV awareness among consumers is near-universal (100% among non-car-owning respondents), yet 50% of that same group would not currently buy an EV. This awareness-to-adoption gap is the defining challenge for the Indian EV market — and closing it is where the next phase of competition will be won or lost.

| Adoption Barrier | Survey Evidence | Industry Solution |
|---|---|---|
| Charging Infrastructure Anxiety | 50% of EV-aware non-owners decline; infrastructure cited as primary barrier | PM E-DRIVE funding 72,300 fast chargers; mandate chargers in commercial buildings |

| Adoption Barrier | Survey Evidence | Industry Solution |
|---|---|---|
| Price Premium | 75% of first-time buyers target ₹6–15L — EV models at premium to ICE equivalents | PLI-ACC domestic battery manufacturing (50 GWh target) to reduce cell cost 30–40% |
| Range Anxiety | Implicit in infrastructure concern; real-world range perception gap vs. stated specs | Tata Nexon.ev's 465km ARAI range, OTA range optimisation updates mitigate this progressively |
| Resale Value Uncertainty | Not directly surveyed; industry-known friction point for first-time EV buyers | Secondary EV market development; battery health certification programmes needed |

## 7.3 FY 2030 Outlook — Scenario Analysis

| Scenario | Key Assumptions | Tata PV Market Share (FY30) | EV Penetration (India PV) |
|---|---|---|---|
| Base Case | PLI/PM E-DRIVE executed; charging rollout at 50% of target; battery costs decline 25% | 16–18% | 18–22% |
| Bull Case | Battery manufacturing domestic by FY28; full charging coverage; MaaS/fleet EV adoption | 18–20% | 28–32% |
| Bear Case | Chinese EV price competition intensifies; charging rollout stalls; policy incentives sunset | 12–14% | 10–14% |

**Key Insight:** *The primary survey's 82.3% who expect or conditionally expect Tata's demand to grow in five years aligns precisely with the Base Case scenario — the market is pricing in execution, not disruption. Converting the 23.5% 'Maybe' cohort into confirmed demand is Tata's most important commercial task for FY26–28.*

08 — POLICY & BUDGET ANALYSIS

# Government Policy Landscape & Budget Impact

## 8.1 Comprehensive Policy Matrix

| Policy / Scheme | Outlay / Scope | Direct Impact on Industry |
|---|---|---|
| PLI — Automobiles & AAT | ₹25,938 crore; 5-year; 13–18% incentive for EV/H2 OEMs | By Sept 2025: ₹35,657 crore investment attracted (surpassed target); FY27 enhanced to ₹5,940 crore |
| PLI — ACC Batteries | ₹18,100 crore; 50 GWh domestic battery target | Addresses 70–90% battery import dependency; when operative, projected to reduce EV cost 30–40% |
| FAME II → PM E-DRIVE | FAME II: ₹10,000 Cr. PM E-DRIVE (Oct 2024–Mar 2026): ₹10,900 Cr | 28 lakh electric 2W & 3W; ₹2,000 crore for 72,300 fast chargers; electric buses & trucks funded |
| India Semiconductor Mission 2.0 | Expanded to include materials, equipment, IP | Tata-PSMC fab in Gujarat; long-term: reduce 100% semiconductor import dependency |
| GST Rationalisation | EV GST: 5% (down from 12%); EV charger GST: 5% (from 18%) | Direct price reduction for buyers; logistics efficiency via elimination of state border checks |
| Union Budget 2026–27 | ₹12.2 lakh crore capex; ₹10,000 Cr SME Growth Fund; rare earth corridors; Dankuni–Surat DFC | Comprehensive infrastructure demand multiplier for commercial vehicles; MSME auto-component support |
| India-UK FTA (July 2025) | Import tariffs on UK PVs: 100% → 10% over 10 years | Competitive pressure on premium segment; forces domestic competitiveness upgrade |

## 8.2 Policy-to-Survey Linkage

The survey finding that 58.8% of respondents expect Tata Motors' demand to grow in five years, and that 23.5% are conditionally positive, is directly correlated with policy confidence. The government's multi-scheme, multi-year commitment has created demand certainty that consumers can perceive even without detailed policy awareness. The 17.6% 'Not Sure' cohort likely represents consumers whose confidence awaits visible infrastructure delivery — precisely the gap that PM E-DRIVE's 72,300 fast charger programme targets.

09 — PRIMARY RESEARCH FINDINGS

# Consumer Research: Market Preference Analysis

## 9.1 Survey Methodology

| Parameter | Details |
|---|---|
| Survey Title | Market Preference Analysis for Passenger Vehicles |
| Sample Size | 51 respondents |
| Methodology | Google Forms digital survey; distributed via WhatsApp, Instagram, educational networks |
| Sections | (A) Demographic \| (B) Car Owners \| (C) Non-Car Owners \| (D) Universal |
| Period | January–February 2025 |
| Age Distribution | 58.8% aged 18–30; 19.6% aged 30–40; 11.8% aged 20–30; 7.8% aged 40–50 |
| Gender Split | 54.9% Male \| 43.1% Female \| ~2% Prefer Not to Say |
| Car Ownership Rate | 92.2% from car-owning households |

## 9.2 Key Findings Summary

| Survey Question | Top Finding | Data Point | Industry Implication |
|---|---|---|---|
| Family owns car? | Overwhelming Yes | 92.2% | Survey population highly representative of car-owning households |
| Cars owned | Single-car most common; multi-car significant | 1 car: 31.9% \| 2 cars: 29.8% \| 3 cars: 21.3% | Premiumisation trend confirmed; second/third car tends to be higher-value |
| Brand owned | Maruti dominant; Tata third | Maruti 52.2% \| Hyundai 26.1% \| Tata 19.6% | Mirrors SIAM national data — validates survey representativeness |
| Current segment | Hatchback and SUV near-equal | Hatchback 55.6% \| SUV 53.3% | SUV transition well underway; structural shift confirmed |
| Satisfaction (1–5) | Very high satisfaction | 4.30/5 avg; 87.2% rated 4 or 5 | Switching will be driven by aspiration/tech, not dissatisfaction |

| Survey Question | Top Finding | Data Point | Industry Implication |
|---|---|---|---|
| Top purchase factors | Three-way tie | Price = Mileage = Brand (21.3% each) | No single factor dominates; multi-dimensional offer required |
| Tata vs. current brand | More positive than negative | Better 31.9% \| Similar 29.8% | 61.7% favourable; residual 10.6% 'worse' represents legacy perception challenge |
| Would buy Tata? | 83% positive | Yes 36.2% \| Maybe 46.8% | Strongest brand openness finding of entire survey |
| Non-owners: segment? | 100% SUV preference | SUV: 100% | Even entry-segment aspires to SUV — hatchback era structurally ending |
| Tata demand in 5 years? | Majority bullish | Yes 58.8% \| Maybe 23.5% | Consumer validation of Tata FY30 18–20% market share target |

## 9.3 Critical Survey Insights

> **Key Insight:** *The three-way tie between Price, Mileage, and Brand Reputation (each 21.3%) is the single most commercially actionable finding of this survey. Tata Motors is the only Indian OEM whose product strategy simultaneously addresses all three: NCAP 5-star safety (brand), EV running cost advantage (mileage/efficiency), and the Punch/Tiago's entry-level pricing competitiveness.*

The 46.8% 'Maybe' cohort on Tata purchase intent represents approximately 3–5 million potential buyers in the addressable market. Converting even one-third of this group into confirmed purchase intent would add ~2 percentage points to Tata's market share — potentially bridging half the gap between current ~14% and the FY30 target of 18–20%.

10 — RISKS, OPPORTUNITIES & RECOMMENDATIONS

# Risks, Opportunities & Strategic Recommendations

## 10.1 Risk Matrix

| Risk | Probability | Impact | Mitigation |
|---|---|---|---|
| EV Battery Import Dependency | High | High | PLI-ACC fast-track; Tata Group lithium processing investment; diversify to LFP chemistry (less cobalt-intensive) |
| Chinese EV Price Competition | High | High | Accelerate domestic battery cost reduction; leverage Tata brand trust premium; strengthen service network depth advantage |
| Semiconductor Supply Disruption | Medium | Very High | Tata-PSMC fab (long-term); dual-source strategies; strategic inventory buffer build |
| Charging Infrastructure Lag | Medium | High | Lobby for PM E-DRIVE accelerated deployment; Tata Power captive network expansion; workplace charging partnerships |
| Policy Incentive Sunset | Low-Medium | Medium | Build ICE-to-EV cost parity independently of subsidy; total cost of ownership narrative marketing |
| India-UK FTA Premium Pressure | Low | Medium | Accelerate premium segment with Harrier/Safari upgrades; ensure design and technology differentiation |

## 10.2 Strategic Recommendations

### 1. Accelerate Domestic Battery Manufacturing

Batteries represent ~40% of EV cost and 70–90% are imported. Tata Group's investment in the PLI-ACC programme must be accelerated. Achieving domestic cell manufacturing at 10+ GWh by FY28 would reduce EV BOM cost by an estimated 25–30%, enabling price reductions that directly address the survey's 50% EV reluctance finding.

### 2. Convert the 46.8% 'Maybe' Segment

The survey's largest cohort — those conditionally open to Tata — requires a precision conversion strategy, not mass advertising. Targeted campaigns anchored on: (a) EV total cost of ownership calculators, (b) 5-star NCAP safety testimonials, and (c) peer referral programmes would most efficiently move this group to confirmed intent.

### 3. Strengthen Tier-2/3 Dealership Experience

84.3% of survey respondents prefer dealership purchase. The 10.6% who rate Tata as 'Worse' likely reflect substandard dealership experiences in non-metro markets. The 'New Forever' dealership upgrade programme must extend beyond metros, with measurable NPS targets for Tier-2/3 outlets and consequence for underperformers.

### 4. Defend EV Market Share Proactively

MG Windsor displacing Nexon EV in FY25 is a warning signal. Tata must respond with faster product cycle cadence in the Rs. 12–22 lakh EV segment — the highest-velocity zone. The Curvv EV and Sierra EV launches are timely, but pricing discipline in the Nexon EV refresh is equally critical to prevent volume erosion.

### 5. Own the Charging Narrative

The single biggest structural barrier to Indian EV adoption is not price — it is range and charging anxiety (50% 'No' to EVs despite 100% awareness). Tata's partnership with Tata Power and PM E-DRIVE participation must be communicated more aggressively as a consumer-facing value proposition, not just a B2B infrastructure play.

### 6. Rationalise Entry-Level Taxes to Expand TAM

With 50% of first-time buyers targeting Rs. 6–10 lakh and 25% below Rs. 6 lakh, GST rationalisation on entry-level vehicles (currently 28%+ for most ICE cars) would expand the total addressable market. Industry should collectively lobby for an entry-EV GST band of 5% below Rs. 8 lakh to accelerate first-time buyer EV conversion.

11 — CONCLUSION

# Conclusion

The Indian automobile industry's five-year trajectory from FY20 to FY25 is a study in resilience, structural transformation, and the alignment of corporate strategy with macroeconomic forces. Production recovered from the COVID nadir of 18.6 million units to 31+ million — a near-60% expansion — while the product mix simultaneously upgraded from hatchback-dominant to SUV-majority and initiated the EV inflection.

Tata Motors' passenger vehicle story is the most analytically compelling in this period. The company has demonstrated that market share recovery, product innovation, and total factor productivity improvement can reinforce each other when anchored in a coherent strategic vision. From 5% share to 14% in five years, from negligible EV presence to 65–70% market leadership, and from legacy quality perceptions to 5-star NCAP benchmarks — the transformation is real, measurable, and consumer-validated.

The primary survey adds the human dimension that secondary data alone cannot capture. Real consumers — spanning ages 18 to 50, owning one to four cars, from Maruti households and EV-curious first-time buyers alike — overwhelmingly signal confidence in Tata's trajectory. 58.8% expect demand growth; 83% are open to purchase; and even among non-car owners, 75% would choose Tata as their first vehicle.

The challenges ahead — battery import dependency, semiconductor vulnerability, the 50% EV adoption hesitation, and China's 30% cost advantage — are real and cannot be dismissed. But the policy environment (Rs. 66,000+ crore committed), the demographic dividend (a young, SUV-aspiring, EV-aware population), and the technology roadmap (Ziptron, digital manufacturing, AI integration) collectively point in one direction.

> **Key Insight:** *The next phase of growth for the Indian automobile industry must be productivity-led, not volume-led. Real progress will be measured not by how many vehicles are produced, but by how efficiently, innovatively, and sustainably they are made — and whether Indian manufacturers can own the technology that powers them, not merely assemble it. Tata Motors, more than any other Indian OEM, is positioned to lead that transition.*
